

Our grass is generally supplied in **both 2m & 4m wide** rolls which are 25m long. We can cut the length to the nearest 0.5m but we cannot cut the width.

Figuring out what size you need if your area is square or rectangular is easy, but can seem daunting if the shape is irregular, but it's not. This chart gives you an indication of three areas and the size of cut you need to order.

In order to reduce waste, see if you can alter the area of your new lawn, so for example if your area is 2.5m x 4.5m you would need a cut 4m x 4.5m resulting in a lot of waste. Could you reduce one dimension by introducing a 500mm planted area to leave the cut at 2m wide x 4.5m long or rotate the grass direction taking 500mm of the 4.5m dimension to give 2.5m long x 4m wide - eliminating waste?

- (a) You order **2m wide** x 4.2m long = **8.40m²**
- (b) You order **4m wide** x 5.2m long = **20.80m²**
- (c) You order **2m & 4m wide** x 8.2m long = **49.20m²** (with 1 joint)

You will see that the actual m² you need to buy may be greater than the planned area, so by planning more carefully, you might be able to save money.

Roughly sketch out your garden shape on the graphs below to see the actual area of grass you need to order. It is advisable for each area to be a single piece to avoid joints, however this is not possible or would result in a lot of waste, it can be joined, just remember to make sure all the pieces have the pile running in the same direction.
